CPLD & FPGA Architectures and Applications

Where to use CPLD or FPGA. When a design requires simple glue-logic or similar functionality which doesn't need to be changed much, or when you need an instant-on circuit, then go for CPLDs. Otherwise, for most other applications FPGAs are generally preferred. Sometimes you can find both CPLD + FPGA in a design.

CPLD vs FPGA: Differences between them and which one to ...

CPLD is used for loading the configuration data of a field programmable gate array from non-volatile memory. Generally, these are used in small design applications like address decoding; CPLDs are frequently used many applications like in cost sensitive, battery operated portable devices due to its low size and usage of low power. Thus, this is ...

FPGAs and CPLDs are two of the well-known types of digital logic chips. When it comes to the internal architecture, the two chips are obviously different. FPGA is short for Field-Programmable Gate Array, is a type of a programmable logic chip. It is great chip as it can be programmed to do almost any kind of digital function.

Difference Between FPGA and CPLD | Difference Between

CPLDS are ideal for high-speed applications requiring critical timing and FPGAs are more flexible with the finer-grained architecture. Lattice semiconductor CPLD series architecture offered predictable timing, high densities, in-system programmability, flexible architecture for mixed combinatorial and register intensive designs and system partitioning.

CPLD vs FPGA. Originally, FPGAs included the blocks in Figure 1 and little else, but now designers can choose from products with a large range of features. Less complex devices such as simple programmable logic devices (SPLDs) and complex programmable logic devices (CPLDs) bridge the gap between discrete logic devices and entry-level FPGAs.

With advancement, the basic FPGA Architecture has developed through the addition of more specialized programmable function blocks. The special functional blocks like ALUs, block RAM, multiplexers, DSP-48, and microprocessors have been added to the FPGA, due to the frequency of the need for such resources for applications.

FPGA (Field Programmable Gate Array) : Architecture and ...

CPLD stands for Complex Programmable Logic Device. It is a programmable logic device that is based on Electrically Erasable Programmable Read Only Memory or EEPROM, has a comparatively less complex architecture as compared to FPGA, and is much more suitable in small gate count designs such as glue-logic.
