Mixed Refrigerant Cycles - Cryogenic Society of America

The refrigerant of this cycle consists of a mixture of nitrogen, methane, ethane, and propane. Mixed refrigerant vapor from the shell side of the main cryogenic heat exchanger is compressed in an axial compressor followed by a two stage centrifugal compressor. Intercooling and initial desuperheating is achieved by air cooling.

In the optimized Cascade process, the mixture to be cooled and condensed is the feed gas. In the propane mixed refrigerant processes, the two mixtures requiring cooling and condensing are the feed gas and the mixed refrigerant. The chief source of inefficiency lies in the heat exchange train during the liquefaction process.
