Emulsion. Colloidal solution is seen as a homogeneous mixture, but it can be heterogeneous as well (e.g. milk, oil in water). Emulsion is a subset of colloid; therefore, it has most of the characteristic of a colloid. The particles in emulsion are of intermediate size (larger than molecules) compared to particles in solutions and suspensions.

Emulsions are considered a type of liquid-liquid colloid. Emulsions are thermodynamically unstable as the dispersed and continuous phases can revert back as separate phases, oil and water, by fusion or coalescence of droplets. However, emulsions are commonly stabilized by an emulsifying agent, often referred to as a surfactant.
